Product Requirements Document

Version 2.1 - Confidential

This document describes the functional requirements for the platform. It is intended for engineering, product and support.

Overview

The system ingests documents, extracts their text and reconstructs a faithful, editable representation of the original layout. Column structure, spacing and emphasis are preserved so that the result can be revised in Word. Each page is analysed independently before the final document is assembled.

Requirements

Images and PDFs are both accepted as input. The service renders PDF pages at a fixed resolution and runs the recognition engine over every region.

Data Model

A page is described as a list of regions. A region is either full width or bound to a single column. Every region owns paragraphs, and every paragraph owns lines.

The exporter walks the regions in reading order and emits Word paragraphs, grouped into a table so that the column gutter is reproduced exactly.

Open Questions

How should hyphenated words at a line break be handled? Should a detected heading force a page break?

End of document.

Appendix A - Glossary

A single column page keeps its own reading order.
Each paragraph is exported with the spacing that was measured
on the page, so the result can be edited without losing its shape.

Terms

Column	A vertical division of the text block that is read top to bottom.
Gutter	The empty space between two columns.
Region	A full width block or a block that belongs to one column.
Slice	A horizontal band of the page that holds one or more regions.
Baseline	The line a row of letters sits on.
Twip	A twentieth of a point, the unit Word uses for measurements.
